**Sales Staff Salaries**

Using the SalesStaff table in the Company database, let the user choose between lists of part-time versus full-time employees. Use radio buttons to display the choices. Display the average salary of the selected group in a label.

When the program starts, the *Full time* button is automatically selected.

Hint: You can use a parameterized query, or create a separate query for part-time and full-time employees. When the user selects a radio button, call the Fill method that matches the appropriate query.
